Schizophrenia, once considered a disorder of relatively pure brain pathology, is increasingly thought to involve a wide range of biological processes including both brain and systemic alterations. To consider the evolution of the current 'neuropathology' paradigm, briefly review the evidence for neuropathological changes in the cortex, hippocampus, cerebellum, diencephalon, limbic system, white matter and basal ganglia of patients with schizophrenia, and consider some of the potential issues in this regard, including issues concerning the reliability and specificity of neuropathological findings. The neuropathology literature points to abnormalities at various levels within the brain with possible persistence and progression of structural changes over time, with features suggestive of hippocampal and neuronal loss in the early stages of the disorder, with additional evidence of cerebellar and white matter changes, and with progression over time with evidence of a wider range of changes including evidence of cortical and limbic pathology. Some of the neuropathological features described in patients with schizophrenia have been associated with a range of other disorders, but others have not been observed in other neuropsychiatric populations. With regard to the specificity of pathology, it may be that schizophrenia is not a uni-dimensional disorder with features of relatively pure brain pathology, but is rather a complex multi-dimensional condition, with a range of altered biological processes and the possibility that some of these processes are associated with the emergence, persistence and progression of clinical symptoms. Q: How to construct html 'div' from javascript var i want to construct a html 'div' from javascript var. How to do this? Here i write some example code: var containerdiv = document.getElementById('containerdiv'); containerdiv.innerHTML += " "; containerdiv.innerHTML += " "; containerdiv.innerHTML += ' '
